Freeware for Windows activity in the healing process of pressure ulcers, while 50 patients received autologous blood transfusion. The results showed that the pressure ulcer healed in a shorter time in the autologous blood transfusion group, but blood transfusion was more expensive. However, they concluded that autologous blood transfusion had faster healing of pressure ulcers and greater quality of life of the patients \[[@cit0021]\]. The results of our study also showed that there was a significant difference in the time of final complete healing of pressure ulcers between the groups (i.e., less time was needed for the ulcers to heal in the NB group). Blood transfusion is one of the essential steps in clinical practice. Many studies have shown the positive effects of blood transfusion on wound healing, but their results are controversial \[[@cit0022]-[@cit0026]\]. Infusion of autologous blood as an alternative to allogenic blood transfusion has been performed in different studies, and there is evidence that autologous blood transfusion accelerates the healing of wounds \[[@cit0027], [@cit0028]\]. Several studies have been performed on patients receiving autologous blood transfusion, and these studies have shown that autologous blood transfusion reduces the inflammatory response, increases fibroblastic activity, and accelerates the fibroblast proliferation and wound healing \[[@cit0029]\]. In recent years, non-traumatic pressure ulcers are very common among patients undergoing CRT in oncologic patients. Several studies have been performed on the effect of autologous blood transfusion on wound healing in such patients. The results have shown that autologous blood transfusion accelerates the healing process of pressure ulcers. The combined results of our study with those of the aforementioned studies showed that autologous blood transfusion is
