## MySpace Blog Exporter Full Version

This is a simple and easy to use application to export a MySpace blog to a WordPress format. You enter the MySpace blog URL, location and filename for the newly created backup. Then, it will do the rest. The invention relates generally to memory access in data processing systems and, more particularly, to buffer management. In computer systems, a processor may access memory either directly or indirectly via a cache. In indirect memory access, the processor issues a memory access request and receives back data, which may be stored in a cache or a main memory. In direct memory access, the processor directly issues the memory access request to the main memory. To maintain coherency between the processor and the main memory, the main memory must provide data to the cache in the same order as the processor would have received the data, in order to avoid having the cache store out-of-date data. When data is requested from main memory, the memory requests the data from its local cache or directly from another main memory. If the data is not in the cache, the memory requests the data from the local main memory. In the latter case, a second main memory local to the cache may be employed. In order to maintain cache coherency between the processor and the cache, the cache must also maintain coherency between the cache and the local main memory. To maintain cache coherency between the processor and the cache, the cache must maintain coherency between the cache and the local main memory. The cache must request a copy of the data from the local main memory. This is referred to as *passing-through*. Coherency between the processor and the cache is thus maintained. One prior art approach to passing-through is illustrated in FIG. 1. FIG. 1 illustrates a memory system 10 having a processor 11 and a cache 12. Cache 12 is coupled to a local main memory 14. A data request 18 is issued to local main memory 14 by cache 12. Data 20 is returned from local main memory 14 to cache 12. At some later time, local main memory 14 requests a second copy of data 20 from local main memory 14. This is done by a local request line 22 to local main memory 14. If request line 22 is to be received by local main memory 14, local request line 22 is activated. The next time data 20 is transferred to cache 12, data 20 is also stored in local main memory 14.

## What's New In MySpace Blog Exporter?

MySpace Blog Exporter can export a MySpace blog and create a backup file. The backup file can be stored at a location you choose. The generated file can be uploaded to WordPress. And, at the end of the process, MySpace Blog Exporter will remove any backup files older than 30 days. Features: - Export MySpace blog to backup file - Upload the backup file to any FTP server - Edit the blog post while you are uploading the file - Change the location of the backup file - Remove files that are older than 30 days Supported Formats: - MySpace - Movable Type - Mambo - TypePad What's New in This Release: Version 2.1: Fixed bug on the location of the backup file.
