How Can I Install a Bitcoin Hard Fork. - Full Bitcoin Blog.O: How to connect router to seperate home and office networks? I'm running an AMI AMI motherboard which has a built in device manager (more details here) to log device changes. This can monitor both WAN and LAN changes. One of the problems with this is that it notifies when a device fails or changes something which it should not be doing. It's made me paranoid, so now I'm trying to find out if there's a way to monitor just the LAN/WAN and then hide that from the rest of my network devices. My idea was to build a WAN/LAN router which only forwards to a certain IP address. I would like to then monitor the device in question (A simple switch) on the LAN (192.168.1.100) but the new router (192.168.0.1) would not have access to the internet. Is this possible, and if so how would I go about it? A: This is possible. You will have to use a bridged or switch mode configuration on the new LAN side of the router. The bridged mode will only forward packets on the port that it receives them on. A switch will forward them to all ports. Most likely your router is a switch, which forwards out 1 port and back in 1 port. That's what I mean by a bridged configuration. When doing this, you'll also have to setup the LAN IP to match the port that your LAN side of the router is on. #!/usr/bin/env python # -\*- coding: utf-8 -\*- "" init.d script for zabbix\_agentd process @author yiyangzhi @date 2017-01-12 @updated 2018-01-21 @release 0.1 "" import os from subprocess import check\_output, Popen, c6a93da74d
